Bayesian Inference and Maximum Entropy Methods in Science and Engineering

Ali Mohammad-Djafari

2001-06-08 Bayesian inference and maximum entropy methods are central points of new scientific inference in mathematical physics and in all inverse problems in engineering and all probabilistic data analysis. This volume contains peer-reviewed selection of the papers presented at this international workshop. Topics included are: axiomatics and concepts,

bayesian parameter estimation, algorithms for bayesian computation, deconvolution and source separation, quantum tomography, tomographic imaging and image processing, as well as bayesian inference in applications.

The critically acclaimed laboratory standard for more than forty years, *Methods in Enzymology* is one of the most highly respected publications in the field of biochemistry. Since 1955, each volume has been eagerly awaited, frequently consulted, and praised by researchers and reviewers alike. More than 270 volumes have been published (all of them still in print) and much of the material is

relevant even today--truly an essential publication for researchers in all fields of life sciences. Crystal Growth Phase Determination Instrumentation and Data Collection Model Building Refinement
Lectures on Algebraic Statistics Mathias Drton
2009-04-25 How does an algebraic geometer studying secant varieties further the understanding of hypothesis tests in statistics? Why would a statistician working on factor analysis raise open problems about determinantal varieties? Connections of this type are at the heart of the new field of "algebraic statistics". In this field, mathematicians and statisticians come together to solve statistical inference problems using concepts from algebraic geometry as well as related computational and combinatorial techniques. The goal of these lectures is to introduce newcomers from the different camps to algebraic statistics. The introduction will be centered around the following three observations: many important statistical

models correspond to algebraic or semi-algebraic sets of parameters; the geometry of these parameter spaces determines the behaviour of widely used statistical inference procedures; computational algebraic geometry can be used to study parameter spaces and other features of statistical models.

Nonlinear Structural Systems Under Random Conditions

Fabio Casciati 1990 The papers in this volume form a bridge between the mathematical and engineering theories in the application of stochastic differential equations. The engineering aspects are represented by a broad spectrum of potential applications and their heuristic or pragmatic approaches to a variety of problems. The mathematical aspects discuss the errors inherent in numerical procedures and provide appropriate theoretical frameworks. The 27 papers presented in this volume testify to the achievement of

Euromech 250 in bringing engineers and mathematicians together in the successful dissemination of recent developments in nonlinear structural systems.
