*Hardware in the Loop Simulation for Industrial Printers* Ricardo Nieto Rodríguez 2019

Hardware in the loop simulation has been used in the last years in the automotive, navigation and aerospace industry to eliminate iterations in the design face of hardware. This process consists in 4 main parts: The controller model or Algorithm, model of the plant, embedded hardware and the real-time processor to generate analog/digital I/O and communications. The aim of this project is to first model a subsystem (plant) that is essential in all the printers and generates a lot of problems, which is the ink delivery system. Second objective of the thesis is to integrate the 4 parts of the HIL running simulations to prove feasibility of the model and comparing it versus reality.

Scilab and its Scicos block diagram graphical editor, with a special emphasis on modeling and simulation tools. The first part is a detailed Scilab tutorial, and the second is dedicated to modeling and simulation of dynamical systems in Scicos. The concepts are illustrated through numerous examples, and all code used in the book is available to the reader.

UNMANNED AIRCRAFT SYSTEMS An  
unmanned aircraft system (UAS), sometimes  
called a drone, is an aircraft without a human  
pilot on board ??? instead, the UAS can be  
controlled by an operator station on the ground  
or may be autonomous in operation. UAS are  
capable of addressing a broad range of  
applications in diverse, complex environments.  
Traditionally employed in mainly military  
applications, recent regulatory changes around  
the world are leading to an explosion of interest  
and wide-ranging new applications for UAS in  
civil airspace. Covering the design, development,  
operation, and mission profiles of unmanned  
aircraft systems, this single, comprehensive  
volume forms a complete, stand-alone reference  
on the topic. The volume integrates with the  
online Wiley Encyclopedia of Aerospace

Engineering, providing many new and updated  
articles for existing subscribers to that work.  
The chapters cover the following items: Airframe  
configurations and design (launch systems,  
power generation, propulsion) Operations  
(missions, integration issues, and airspace  
access) Coordination (multivehicle cooperation  
and human oversight) With contributions from  
leading experts, this volume is intended to be a  
valuable addition, and a useful resource, for  
aerospace manufacturers and suppliers,  
governmental and industrial aerospace research  
establishments, airline and aviation industries,  
university engineering and science departments,  
and industry analysts, consultants, and  
researchers.
