Traffic Management Between Two Cities Across MPLS Backbone with Two Servers Ari Taha Guron 2017 Data traffic occurs in most networks with different servers. When several routers try to forward packets, congestion happens. To resolve this issue there are several algorithms to avoid congestion and traffic in the network. In this project, traffic management between two different cities are evaluated and tested across Multi-Protocol-Label-Switching (MPLS) backbone. Further, in the project there are two servers assembled with switch and connected to routers. One of the servers is video server which is in real time and the other one is ftp server which is none real time. For both servers, packet loss, throughput and delay is examined to see the traffic and the delay between packets. Besides, Quality of Service (QoS) which plays as a key character is evaluated to see the quality of packets routed in the network. The project is done and implemented using GNS3 open source software. The monitoring and evaluation is done through Wireshark networking monitoring software. The whole idea behind the project is to monitor packets for different servers, FTP server and video, to measure delay, jitter, and throughput and packet loss for each separately. Finally, all simulation is conducted through Wireshark and GNS3 software to prepare a report for network analysis. In this project, MPLS is used to reduce the impact of network congestion or to eliminate it. MPLS is used to direct packets from one node to another. MPLS operates between

layer 2 and layer 3 which is considered as layer 2.5 level. Regarding methodology, the entire project was done using GNS3 network emulation which is an open source software used to emulate different kinds of networking related projects. Furthermore, within the software there is forum which questions can be asked and problems are stated to get the solution. Simulation results differ from each scenario and have different analysis. For instance, if video server taken to consideration there is different result for both places Hawler and Slemany and for both qualities HD and SD. As an instance, in HD quality delay and packet loss is higher than SD quality video likewise the difference between Hawler and Slemany in distance. In addition, for FTP server also there is delay and packet loss in both cities but with different ranges.

HIPAA Protected Delivery Across Internet Parth P. Shirke 2016 Abstract: VPN (Virtual Private Network) is a method of providing a secure connection between a source (computer/server) and a destination host. The connection is secured not on the basis of employing a dedicated channel between the source and destination host, but instead the connection is secured over the public internet. VPN is implemented in a hospital network to meet the Health Insurance Protection and Accountability Act (HIPAA) regulations. HIPAA is a directive that compels the medical centers and clinics to handle an individual electronic medical record securely; free from any nature of breaching. In an effort to execute the VPN on a hospital network that complies with HIPAA, this project is focused on creating a network simulation with the VPN including other networking features. The VPN enabled network is accomplished using the GNS3 network simulation software. The data through the VPN tunnel are encoded and observed in Wireshark Software. In the conclusion we will observe the state, unencrypted and encrypted, of the packets before and after, respectively, applying the VPN to the border routers through which the IP packets are traveling via the insecure Public Internet.

Traffic Management Between Two Locations Across Multiprotocol Label Switching Backbone Cloud with Enhanced Network Security

Ashish Rao Janardhan Rao 2015 Abstract: The purpose of this project is to manage network traffic across a Multi-Protocol Label Switching (MPLS) backbone cloud between two locations and to implement network security by applying enable, telnet, line console, vty and auxiliary port passwords. Mobility and cloud are reshaping the way people work. Today people are working from anywhere inside and outside the workplace using both private and public internet access, Wi-

Fi and even mobile broadband [3]. Customers have the flexibility to opt for Multi-Protocol Label Switching-Virtual Private Network services internet connectivity from various service providers. Customers can provide internet connectivity directly from their network either from remote site or a central site depending on the requirement. Security is also an important concern for customers when they connect to public networks, therefore firewall deployment is necessary. In this project we aim to manage data traffic across a Multi-Protocol Label Switching backbone cloud between an office in Bangalore, India and two offices in California, United States of America. We will also set up a firewall and apply telnet and login passwords to it. Quality of Service is also applied on a particular part in the topology. The entire project will be simulated on network simulation platform GNS3 which is an emulation software.
