Manual on the Use of Timber in Coastal and
River Engineering Matt Crossman 2004 This
informative manual has been designed to
provide guidance on the principal issues
surrounding the use of timber in coastal and

river engineering. For centuries timber has
traditionally been used for the construction of a
wide range of coastal and river structures
including: groynes, jetties, lock gates, navigation
aids and riverbank protection. It is an attractive
choice of construction material because it is
renewable, is easy to use, repair and recycle, has
a high strength/weight ratio and is visually
appealing.

A Handbook for the Sustainable Use of

Timber in Construction Jim Coulson
2020-12-07 There is a growing interest in the use of wood in new building, not least because it has low embodied energy and it is an infinitely renewable resource. Despite a great deal of innovation in the use of wood in construction in recent years, the fundamentals of using this natural material have not really changed: the different types of wood have different properties and differing responses to the environment in which they are used. When used correctly, wood is an excellent building material but when inappropriately specified or used, it may cause problems. Poor understanding of the properties of wood and the many species and grades that are commercially available can result in this versatile material performing below expectation, and certainly less well than could have been achieved with greater understanding about how best to use it. How Wood Works is a combination of the author's two previous books, into one comprehensive volume. Revised and updated

material to deal with the essentials of structural design and building in timber, in a sustainable manner while reflecting on changes in Standards and other Regulations and expanding on certain technical areas - such as more detailed wood science and wood structure.
