Microwave Engineering Sudhakar M. & Khare Vandana 2017

Microwave Engineering is intended as textbook catering needs of third year undergraduate students of Electronics & Communication Engineering. Microwave Engineering is a prerequisite for courses like Radar Systems, Microwave Integrated Circuits and Satellite Communications.

Electromagnetic Waves and Radiating Systems Dr. Gopinath Balakrishnan, Dr. Nithyakalyani Selvarajan, Dr. Devika S.V, Mr. Bhushan Sanjay Patil 2025-12-26 Electromagnetic Waves and Radiating Systems deal with the generation, propagation, and radiation of electromagnetic energy through space. Electromagnetic waves consist of electric and magnetic fields oscillating perpendicular to each other and travel at the speed of light. Radiating systems, such as antennas, convert electrical signals into electromagnetic waves for wireless communication. This subject covers key concepts including wave polarization, radiation patterns, impedance matching, and antenna parameters. These principles are essential in applications like radio broadcasting, satellite communication, radar, and mobile networks. Overall, electromagnetic

waves and radiating systems form the foundation of modern wireless technologies.

Electromagnetics for Engineering Students (Part 2) Sameir M. Ali Hamed 2018-04-09 Electromagnetics for Engineering Students is a textbook in two parts, Part I and II, that cover all topics of electromagnetics needed for undergraduate students from vector analysis to antenna principles. In both parts of the book, the topics are presented in sufficient details such that the students will follow the analytical development easily. Each chapter is supported by many illustrative examples, solved problems, and the end of chapter problems to explain the principles of the topics and enhance the knowledge of the student. There are a total of 681 problems in the both parts of the book as follows: 162 illustrative examples, 88 solved problems, and 431 end of chapter problems. This part is a continuation of Part I and focuses on the application of Maxwell's equations and the concepts that are covered in Part I to analyze the characteristics of wave propagation in half-space and bounded media including metamaterials. Moreover, a chapter has been devoted to the topic of antennas to provide readers with the fundamental concepts related to antenna engineering. The key features of this part: • In addition to the coverage of classical topics in electromagnetic normally covered in the similar available texts, this part of the book adds some advanced concepts and topics such as: • Application of multi-pole expansion for vector potentials. • More detailed analysis on the topic of waveguides including circular waveguides. • Refraction through metamaterials and the concept of negative refractive index. • Detailed and easy-to follow presentation of mathematical analyses and problems. • An appendix of mathematical formulae and functions.

Theory of Waveguides and Transmission Lines Edward F. Kuester 2020-09-19 This book covers the principles of operation of electromagnetic waveguides and transmission lines. The approach is divided between mathematical descriptions of basic behaviors and treatment of specific types of waveguide structures. Classical (distributed-network) transmission lines, their basic properties, their connection to lumped-element networks, and the distortion of pulses are discussed followed by a full field analysis of waveguide modes. Modes of specific kinds of waveguides - traditional hollow metallic waveguides, dielectric (including optical) waveguides, etc. are discussed. Problems of excitation and scattering of waveguide modes are addressed, followed by discussion of real systems and performance.
