Beyond PD-1: novel checkpoint receptors and ligands as targets

for immunotherapy Jesse Haramati 2025-02-24 The incredible power of the immune system to control or eliminate neoplasias has been made evident by the success of immune checkpoint inhibitors (ICI). While inhibitory checkpoint receptors are critical for the maintenance of hemostasis under physiological conditions, dysregulation in the tumor microenvironment perturbs the role of these molecules with the promotion of exhausted cytotoxic cells, that is cytotoxic cells that no longer are able to control tumors. ICI leverages these targets to redirect cytotoxic responses and neutralize the suppressive tumor microenvironment. However, not all tumor types or patients respond to

these therapies. Great interest continues to be focussed on first-generation ICI therapy (PD-1/PD-L1 and CTLA-4) but the potential for other targets and ligands remains vast.
