Images of Time George Jaroszkiewicz 2016-01-21 Have you ever wondered about Time: what it is or how to discuss it? If you have, then you may have been bewildered by the many different views and opinions in many diverse fields to be found, such as physics, mathematics, philosophy, religion, history, and science fiction novels and films. This book will help you unravel fact from fiction. It provides a broad survey of many of these views, these images of time, covering historical, cultural, philosophical, biological, mathematical and physical images of time, including classical and quantum mechanics, special and general relativity and cosmology. This book gives you more than just a review of such images. It provides the reader a basis for judging the scientific soundness of these various images. It develops the reader's critical ability to distinguish Images of Time in terms of its contextual completeness. Differentiating between metaphysical images (which cannot be scientifically validated) and those that could, in principle, be

put to empirical test. Showing that mathematical and classical mechanical images are more complete, and genuine quantum mechanics based images have the greatest degree of contextual completeness. Through the use of a simple algorithm, the reader can decide the classification of any of the images of time discussed in this book. These distinctions are of particular importance in this day and age, when we are flooded by a plethora of competing Images of Time. Many of these have no scientific basis or empirical support or content. This book will be of value not only to philosophers, scientists and students, but also to the general reader interested in this fundamental topic, because it introduces a method of distinguishing between science fiction and science fact.

Analysis and Interpretation in the Exact Sciences Melanie Frappier

2012-02-26 The essays in this volume concern the points of intersection

between analytic philosophy and the philosophy of the exact sciences.

More precisely, it concern connections between knowledge in mathematics and the exact sciences, on the one hand, and the conceptual foundations of knowledge in general. Its guiding idea is that, in contemporary philosophy of science, there are profound problems of theoretical interpretation-- problems that transcend both the methodological concerns of general philosophy of science, and the technical concerns of philosophers of particular sciences. A fruitful approach to these problems combines the study of scientific detail with the kind of conceptual analysis that is characteristic of the modern analytic tradition. Such an approach is shared by these contributors: some primarily known as analytic philosophers, some as philosophers of science, but all deeply aware that the problems of analysis and interpretation link these fields together.

Bridging Circuits and Fields Alexander I. Petroianu 2021-11-29 Energy and power are fundamental concepts in electromagnetism and circuit theory, as well as in optics, signal processing, power engineering, electrical machines, and power electronics. However, in crossing the disciplinary borders, we encounter understanding difficulties due to (1) the many possible mathematical representations of the same physical objects, and (2) the many possible physical interpretations of the same mathematical entities. The monograph proposes a quantum and a relativistic approach to electromagnetic power theory that is based on recent advances in physics and mathematics. The book takes a fresh look at old debates related to the significance of the Poynting theorem and the interpretation of reactive power. Reformulated in the mathematical language of geometric algebra, the new expression of electromagnetic power reflects the laws of conservation of energy-momentum in fields and circuits. The monograph offers a mathematically consistent and a physically coherent interpretation of the power concept and of the mechanism of power transmission at the subatomic (mesoscopic) level. The monograph proves (paraphrasing Heaviside) that there is no finality in the development of a vibrant discipline: power theory.

Influences on the Aufbau Christian Damböck 2015-12-28 This volume offers 11 papers that cover the wide spectrum of influences on Rudolf Carnap's seminal work, *Der Logische Aufbau der Welt* (The Logical Structure of the World). Along the way, it covers a host of topics related to this important philosophical work, including logic, theories of order, science, hermeneutics, and mathematics in the Aufbau, as the work is commonly termed. The book uncovers the influences of such neglected figures as Gerhards, Driesch, Ziehen, and Ostwald. It also presents new evidence on influences of well-known figures in philosophy, including Husserl, Rickert, Schlick, and Neurath. In addition, the book offers comparisons of the Aufbau with the work of contemporary scientists such as Weyl and Wiener as well as features new archival findings on the early Carnap. This book will appeal to researchers and students with an interest in the history and philosophy of science, history of analytic philosophy, the philosophy of the Vienna Circle, and the philosophy in interwar Germany and Austria.
