Stone Knapping Valentine Roux 2005 How were early stone tools made, and what can they tell us about the development of human cognition? This question lies at the basis of archaeological research on human origins and evolution, and the present volume fulfils a growing need among advanced students and researchers working in this field. The individual chapters by a range of leading international scholars approach stone knapping from a multidisciplinary perspective that embraces psychology, physiology, behavioural biology and primatology as well as archaeology. The skills and behaviour of humans and their primate relatives are key parts of the enquiry. The result is a better understanding of early human engagement with the material world and the complex actions required for the creation of stone tools. The book contains many illustrations and is extensively referenced, and provides a landmark contribution in this field.

Handbook of Human Symbolic Evolution Andrew Lock 1996 A reference work that should be a first port of call for students and researchers in any discipline studying fundamental questions concerning the origins and nature of human symbolic abilities. The book is about the evolution of humanity: our language, art, tools, and communication. As such it covers a wide range of disciplines: anthropology, psychology, primatology, paleontology, and archaeology. The various topics are dealt with by experts from each field, in articles that provide summaries that are scholarly but will also be comprehensive to the many people (both lay and professional) who are interested in human evolution.

Neurobiology of human language and its evolution: Primate and Nonprimate Perspectives

Constance Scharff The evolution of human language has been discussed for centuries from different perspectives. Linguistic theory has proposed grammar as a core part of human language that has to be

considered in this context. Recent advances in neurosciences have allowed us to take a new neurobiological look on the similarities and dissimilarities of cognitive capacities and their neural basis across both closely and distantly related species. A couple of decades ago the comparisons were mainly drawn between human and non-human primates, investigating the cytoarchitecture of particular brain areas and their structural connectivity. Moreover, comparative studies were conducted with respect to their ability to process grammars of different complexity. So far the available data suggest that non-human primates are able to learn simple probabilistic grammars, but not hierarchically structured complex grammars. The human brain, which easily learns both grammars, differs from the non-human brain (among others) in how two language-relevant brain regions (Broca's area and superior temporal cortex) are connected structurally. Whether the more dominant dorsal pathway in humans compared to non-human primates is causally related to this behavioral difference is an issue of current debate. Ontogenetic findings suggest at least a correlation between the maturation of the dorsal pathway and the behavior to process syntactically complex structures, although a causal prove is still not available. Thus the neural basis of complex grammar processing in humans remains to be defined. More recently it has been reported that songbirds are also able to distinguish between sound sequences reflecting complex grammar. Interestingly, songbirds learn to sing by imitating adult song in a process not unlike language development in children. Moreover, the neural circuits supporting this behavior in songbirds bear anatomical and functional similarities to those in humans. In adult humans the fiber tract connecting the auditory cortex and motor cortex dorsally is known to be involved in the repetition of spoken language. This pathway is present already at birth and is taken to play a major role during language acquisition. In songbirds, detailed information exist concerning the interaction of auditory, motor and cortical-basal ganglia processing during song learning, and present a rich substrate for comparative studies. The scope of the Research Topic is to bring together contributions of researchers from different fields, who investigate grammar processing in humans, non-human primates and songbirds with the aim to find answers to the question of what constitutes the neurobiological basis of grammar learning. Open questions are: Which brain networks are relevant for grammar learning? Is there more than one dorsal pathway (one from temporal cortex to motor cortex and one to Broca's area) and if so what are their functions? Has the ability to process sequences of a given hierarchical complexity evolved in different phylogenetic lines (birds, primates, other vocal production learners such as bats)? Is the presence of a sensory-to-motor circuit in humans a precondition for development of a dorsal pathway between the temporal cortex and Broca's area? What role do subcortical structures (Basal Ganglia) play in vocal and grammar learning?

Handbook of Cultural Psychology Shinobu Kitayama 2010-01-01 Bringing together leading authorities, this definitive handbook provides a comprehensive review of the field of cultural psychology. Major theoretical perspectives are explained, and methodological issues and challenges are discussed. The volume examines how topics fundamental to psychology?identity and social relations, the self, cognition, emotion and motivation, and development?are influenced by cultural meanings and practices. It also presents cutting-edge work on the psychological and evolutionary underpinnings of cultural stability and change. In all, more than 60 contributors have written over 30 chapters covering such diverse areas as food, love, religion, intelligence, language, attachment, narratives, and work.

Animal Creativity and Innovation 2015-10-29 Animal Creativity and Innovation explores theories and research on animal innovation and creativity, comparing and contrasting it with theory and research on human creativity and innovation. In doing so, it encompasses findings from psychology, biology, neuroscience, engineering, business, ecology, and education. The book includes examples of animal innovation in parrots, dogs, marine mammals, insects, and primates, exploring parallels from creative play

in children. The book defines creativity, differentiating it from play, and looks at evolutionary models and neurological constructs. The book further explores applied aspects of animal innovation and creativity including tool use and group dynamics, as well as barriers to creativity. The final chapters look into how creative behavior may be taught or trained. Each chapter is followed by a commentary for integration of thoughts and ideas between animal and human research, behavioral and cognitive research, and theory and observation in real life. - Compares theory and research on animal and human creativity - Defines and differentiates creativity from play - Reviews applied creativity in tool use and social dynamics - Includes examples of animal creativity in multiple species

Evolution of Nervous Systems Georg F. Striedter 2016-11-23 Evolution of Nervous Systems, Second Edition, Four Volume Set is a unique, major reference which offers the gold standard for those interested both in evolution and nervous systems. All biology only makes sense when seen in the light of evolution, and this is especially true for the nervous system. All animals have nervous systems that mediate their behaviors, many of them species specific, yet these nervous systems all evolved from the simple nervous system of a common ancestor. To understand these nervous systems, we need to know how they vary and how this variation emerged in evolution. In the first edition of this important reference work, over 100 distinguished neuroscientists assembled the current state-of-the-art knowledge on how nervous systems have evolved throughout the animal kingdom. This second edition remains rich in detail and broad in scope, outlining the changes in brain and nervous system organization that occurred from the first invertebrates and vertebrates, to present day fishes, reptiles, birds, mammals, and especially primates, including humans. The book also includes wholly new content, fully updating the chapters in the previous edition and offering brand new content on current developments in the field. Each of the volumes has been carefully restructured to offer expanded coverage of non-mammalian taxa, mammals, primates, and the human nervous system. The basic principles of brain evolution are discussed, as are mechanisms of change. The reader can select from chapters on highly specific topics or those that provide an overview of current thinking and approaches, making this an indispensable work for students and researchers alike. Presents a broad range of topics, ranging from genetic control of development in invertebrates, to human cognition, offering a one-stop resource for the evolution of nervous systems throughout the animal kingdom Incorporates the expertise of over 100 outstanding investigators who provide their conclusions in the context of the latest experimental results Presents areas of disagreement and consensus views that provide a holistic view of the subjects under discussion

Evolution in Mind Henry Plotkin 1998 From the nature-nurture question which has occupied philosophers and scientists for thousands of years to the most recent debates about how the mind is structured, Plotkin looks at what it means to be human from an evolutionist's perspective.

Torrey's Morphogenesis of the Vertebrates Alan Feduccia 1991-01-24 This updated, streamlined, generously illustrated Fifth Edition of the classic text combines comparative vertebrate anatomy and embryology into one easy reference source. Provides an overview of vertebrate evolution, a preview of vertebrate embryology, six chapters on vertebrate development, and then goes through each organ system from both a morphogenesis and comparative anatomy standpoint. Also includes extensive discussions of vertebrate evolution, a large section on developmental preliminaries, an extensive glossary and a new bibliography.

Piaget, Evolution, and Development Jonas Langer 1998-06 This volume brings the current interest in primate cognition to bear on studies of cognitive development in humans, with chapters from leading researchers in both areas. For cognitive developmentalists and primatologists and comparative psychologists.
