Metallurgy and Technology of Steel Castings Jan Głownia 2017-12-22 Metallurgy and Technology of Steel Castings is a comprehensive textbook for students and professional engineers in the field of foundry engineering and materials science. The topics covered in this book explain the association between the quality of liquid metal and the properties of the finished cast. Readers will learn about the thermodynamic conditions for addition and recovery of chemical elements (such as Cr, Ni and Mo) in steel, degasifying processes, the influence of alloying additives for manufacturing steel castings that operate in extreme temperatures, anti-corrosive steels and basic cast conditions for making the castings (pouring and heat treatment systems). Metallurgy and Technology of Steel Castings gives readers essential information about steel and steel cast manufacturing processes and equips them with the knowledge to overcome the challenges faced in the foundry environment.

Painting Still Life in Oils Adele Wagstaff

2015-05-31 Still life painting is an exciting genre, which allows the artist to explore colour, shape and form using as many or as few objects as they like. A still life can be quiet, tranquil and contemplative in mood, or be a celebration of pure colour and expression. This book introduces the genre using the medium of oil paint as a step-by-step process, from painting simple compositions of one object to complex arrangements of more unusual subject matter. Each chapter focuses on a different aspect of preparing for a painting: from studying a still life using a variety of drawing techniques to basic colour theory; from painting with a limited tonal range to using the full impressionist palette. The compositions studied include traditional still life subjects and more unusual objects, and advice is given on materials, including how to stretch your

own canvas. The work of notable still life painters is used as inspiration for your work, and the book introduces painting still life within the genre of portraiture. Aimed at beginners and the more experienced; untutored groups and individual artists and beautifully illustrated with 190 colour illustrations.

Modern Color/Modern Architecture William W. Braham 2019-05-29 This title was first published in 2002. This really is a text that will fill a long-felt want. A key figure in that history is Amédée Ozenfant, painter, critic and friend of Le Corbusier, who in the first half of this century founded a school in London where he conducted experiments and wrote about color in architecture. Those experiments have been reconstructed for the book, which also includes reprints of his most important articles on the subject. This book provides a fascinating survey of this most contemporary topic that will inspire and inform designers and architects. Color has often been regarded as the final dressing of a building, subject to the vagaries of fashion and left to the client to select. There have been a number of studies of polychromy in the architecture of the more distant past, particularly in relation to modern conservation practices, but there is little or nothing on the architectural color of recent times, and especially within Modernism.

Sustainable Architecture - Between Measurement and Meaning

Carmela Cucuzzella 2021-01-05 Each day new articles, books, and reports present new methods, standards, and technologies for achieving sustainability in architecture. Additionally, new materials, technological gadgets, and data are increasingly considered the staples of architecture's future. As we increasingly embrace this techno-advancement, we must be equally aware that we may be pushing architecture into a managerial science and away from its core concerns such as expression, contextuality, functionality and aesthetics. Sustainable architecture that is focused on the abstract measurements of consumption, energy, and emissions loses sight of the vital role that

architecture holds in our world: it is the field that creates our public spaces and our places of dwelling, of business, of production, of leisure, and creation. Additionally, it fails to comprehend the human dimension of buildings, as elements that are deeply connected to their sites' historic contexts and that play a key role in defining our social relations and our connection to the spaces we occupy and utilize. "Sustainable Architecture - Between Measurement and Meaning" takes a step back to reflect on how sustainability in the built environment can be theorized and practiced critically. This book exposes that architecture remains a human and social science that lies at the intersection of measurements and meanings. It reveals that sustainable architecture can still operate in a dialectic space of expression, rather than serving as a manifesto for either the technical or socio-cultural extremes. It purports that the human intuition, senses, and skills still holds the key to unravelling alternative futures of sustainable built spaces. And that most importantly, humans still have a place in sustainable architecture. This book will be of interest to students, early career scholars, established researchers and practitioners studying sustainability in the built environment. It can be used as a reference to those in the fields of design, architecture, landscape and urban design, urban studies, geography, social sciences, and engineering.

Ultimate Limit State Design of Steel-Plated Structures Jeom Kee Paik 2003-03-28 Steel plated structures are important in a variety of marine and land-based applications, including ships, offshore platforms, power and chemical plants, box girder bridges and box girder cranes. The basic strength members in steel plated structures include support members (such as stiffeners and plate girders), plates, stiffened panels/grillages and box girders. During their lifetime, the structures constructed using these members are subjected to various types of loading which is for the most part operational, but may in some cases be extreme or even accidental. Ultimate Limit State Design of Steel Plated Structures reviews and describes both

fundamentals and practical design procedures in this field. The derivation of the basic mathematical expressions is presented together with a thorough discussion of the assumptions and the validity of the underlying expressions and solution methods. Particularly valuable coverage in the book includes: * Serviceability and the ultimate limit state design of steel structural systems and their components * The progressive collapse and the design of damage tolerant structures in the context of marine accidents * Age related structural degradation such as corrosion and fatigue cracks Furthermore, this book is also an easily accessed design tool which facilitates learning by applying the concepts of the limit states for practice using a set of computer programs which can be downloaded. In addition, expert guidance on mechanical model test results as well as nonlinear finite element solutions, sophisticated design methodologies useful for practitioners in industries or research institutions, selected methods for accurate and efficient analyses of nonlinear behavior of steel plated structures both up to and after the ultimate strength is reached, is provided. Designed as both a textbook and a handy reference, the book is well suited to teachers and university students who are approaching the limit state design technology of steel plated structures for the first time. The book also meets the needs of structural designers or researchers who are involved in civil, marine and mechanical engineering as well as offshore engineering and naval architecture.

Assessment and Refurbishment of Steel Structures Zoltan Agocs 2004-12-02 The material properties, spatial configuration and variation in the construction of steel structures means they often have the potential for reconstruction. This book provides civil engineers with the necessary information to approach projects of reconstruction and reinforcement of steel structures such as buildings, masts, towers, chimneys, storage

Steel - A New and Traditional Material for

Building Dan Dubina 2026-02-02 In an era of new, composite materials and high-strength concrete, and with an increasing demand for sustainable building technologies, the importance of the role of steel in construction is being challenged.. Nonetheless, steel can successfully be used to refurbish and retrofit historical buildings, as well as being a material of choice for new building structures. Steel can effectively be combined with a variety of other materials to obtain structures which are characterized by a high-performance response under different types of static and dynamic activity. The proceedings contains nine keynote lectures from international experts, and is further divided into five sections: calculation models and methods; studies and advances in design codes; steel and mixed building technology; steel under exceptional actions; and steel in remarkable constructions and refurbishment.

Basic Concepts of Iron and Steel Making

Sujay Kumar Dutta 2020-03-02 This book presents the fundamentals of iron and steel making, including the physical chemistry, thermodynamics and key concepts, while also discussing associated problems and solutions. It guides the reader through the production process from start to finish, covers the raw materials, and addresses the types of processes and reactions involved in both conventional and alternative methods. Though primarily intended as a textbook for students of metallurgical engineering, the book will also prove a useful reference for professionals and researchers working in this area.

Limit State of the Plate Elements of Steel

Structures J. Dzubek 2013-03-13 The necessity to save steel leads to a marked tendency towards thin-walled structures. Such structures are made of thin plating, the behaviour - and, of course, design - of which is very significantly affected by stability phenomena. In fact, with up-to-date thin-walled steel plated structures, it is very frequently the point of view of stability that governs the design. So it is not astonishing that the attention of a great number of research teams in various parts of the world has been for a good many years directed to investigations into numerous aspects of the buckling behaviour of steel plated structures. However, the current

problems of buckling research, which require to account for the effect of initial imperfections, post-buckled behaviour and plastic reserve of strength (this leading in theoretical research to the necessity to solve boundary value problems of geometrically and physically non-linear partial differential equations, and in experimental studies to conduct experiments on full-size test girders) are very complex and time-consuming. Then it is beyond the means of one investigator, or even of one research team, to deal successfully with such problems and, consequently, effective cooperation is indispensable. This was also the reason for the initiation of a fruitful collaboration between the first author of this book (Assoc. Prof. J. Dzubek, D. Sc.) and the third author (Assoc. Prof. M. Skaloud, D. Sc. Recent Progress in Steel and Composite Structures Marian A. Steel Plate Shear Walls with Gravity Load: Theory and Design Yang Lv 2022-02-10 This book is written by subject experts based on the recent research results in steel plate shear walls considering the gravity load effect. It establishes a vertical stress distribution of the walls under compression and in-plane bending load and an inclination angle of the tensile field strip. The stress throughout the inclined tensile strip, as we consider the effect of the vertical stress distribution, is determined using the von Mises yield criterion. The shear strength is calculated by integrating the shear stress along the width. The proposed theoretical model is verified by tests and numerical simulations. Researchers, scientists and engineers in the field of structural engineering can benefit from the book. As such, this book provides valuable knowledge, useful methods, and practical algorithms that can be considered in practical design of building structures adopting a steel shear wall system.

"My brothers have my back" Lou Pepi 2018-10-16 In November 1969, what Time Magazine called the "largest battle of the year" took place less than two miles from the Vietnamese Demilitarized Zone. Three companies of Task Force 1-61 met 2,000-3,000 North Vietnamese. American forces fought for two days, inflicting heavy casualties and suffering eight killed. Late on November 12, it became evident that the American position could be overrun. Alpha Company was airlifted in darkness to reinforce a small hill in the jungle. Three hours later, well past midnight, the Americans were attacked by 1,500 NVA. There was a twist: A secret Vietcong document captured near Saigon urged intense action before November 14 in anticipation of the Vietnam War Moratorium Demonstrations set for November 15 in many cities in America. The Vietcong planned to inflict a stunning defeat in "an effort to get the fighting in step with the peace marchers." The author, a member of Alpha Company who rode in on the last

helicopter, offers unique insights into the story of the men who fought those three days in 1969.

Building Character Charles L. Davis II 2019-09-06 In the nineteenth-century paradigm of architectural organicism, the notion that buildings possessed character provided architects with a lens for relating the buildings they designed to the populations they served. Advances in scientific race theory enabled designers to think of "race" and "style" as manifestations of natural law: just as biological processes seemed to inherently regulate the racial characters that made humans a perfect fit for their geographical contexts, architectural characters became a rational product of design. Parallels between racial and architectural characters provided a rationalist model of design that fashioned some of the most influential national building styles of the past, from the pioneering concepts of French structural rationalism and German tectonic theory to the nationalist associations of the Chicago Style, the Prairie Style, and the International Style. In *Building Character*, Charles Davis traces the racial charge of the architectural writings of five modern theorists—Eugene Emmanuel Viollet-le-Duc, Gottfried Semper, Louis Sullivan, Frank Lloyd Wright, and William Lescaze—to highlight the social, political, and historical significance of the spatial, structural, and ornamental elements of modern architectural styles.
