Condition-Based Maintenance and Residual Life Prediction

Chandan Deep Singh

2025-04-15 Condition-Based Maintenance and Residual Life Prediction is essential for those looking to effectively implement condition-based maintenance strategies and enhance fault detection through a comprehensive understanding of vibration data analysis and residual life prediction, addressing key challenges in the field. Issues related to condition-based maintenance include its high initial cost, new techniques that can be difficult to implement due to resistance, older equipment that can be difficult to retrofit with sensors and monitoring equipment, and difficult-to-access equipment during production that is difficult to spot-measure. Keeping the above issues in mind, a general handbook for

condition-based maintenance and residual life prediction is required to carry out in fault detection. Condition-Based Maintenance and Residual Life Prediction aims to develop, analyze, and model condition-based maintenance and residual life prediction through vibration data. The analysis of vibration responses will aid in developing a fault detection system. The sources of vibration may be due to the presence of different types of defects, such as cracks in the shaft, a bent shaft, or misalignment of shafts. This will give designers a diagnostic tool for predicting the trends of vibration conditions, leading to early fault detection. The devised tool will be capable of quantifying the amplitude of vibration based on the severity of defects. With the features available in the devised diagnostic tool, the proposed model can be used for design,

predictive maintenance, and condition-based maintenance.

Computational Techniques and Smart Manufacturing

Paolo Ferro 2026-02-27 This book delves into theoretical foundations as well as practical applications of emerging technologies shaping Industry 4.0 to explore the integration of modern computational methods with advanced manufacturing processes. This book explores key areas where computational techniques significantly enhance manufacturing performance, including finite element analysis (FEA), computational fluid dynamics (CFD), design optimization, machine learning, and digital twins. It addresses applications in advances in manufacturing, machining, welding, casting, and forming processes. Case studies demonstrate how simulation-based design reduces trial-and-error in process development, while optimization algorithms improve dimensional accuracy, surface quality, and energy efficiency. Chapters also cover the role of AI in predictive maintenance, process control, and real-time decision-making. This is a vital resource for researchers, academicians,

industry professionals, and students working in the fields of computational techniques, smart materials, automation, and advanced manufacturing. Practical Limits of Efficiency of Engines 1986
