*The Hierarchy of Energy in Architecture* Ravi Srinivasan

2015-06-12 The laws of thermodynamics—and their implications for

architecture—have not been fully integrated into architectural design.

Architecture and building science too often remain constrained by linear concepts and methodologies regarding energy that occlude significant quantities and qualities of energy. *The Hierarchy of Energy in Architecture* addresses this situation by providing a clear overview of what energy is and what architects can do with it.

Building on the emergy method pioneered by systems ecologist Howard T. Odum, the authors situate the energy practices of architecture within the hierarchies of energy and the thermodynamics of the large, non-equilibrium, non-linear energy systems that drive buildings, cities, the planet and universe. Part of the

PocketArchitecture series, the book is divided into a fundamentals section, which introduces key topics and the emergy methodology, and an applications section, which features case studies applying emergy to various architectural systems. The book provides a concise but rigorous exposure to the system boundaries of the energy systems related to buildings and as such will appeal to professional architects and architecture students.

**Building Energy Calculator**  
Jonathan York Smith 2004  
Buildings are one of the world's largest consumers of energy, yet measures to reduce energy consumption are often ignored during the building design process. In developing countries, enormous numbers of new residential buildings are being constructed each year, and many of these buildings perform very poorly in terms of energy efficiency. One of the major barriers to better building designs is the lack of tools to aid architects during the preliminary design stages. In order to address the need for feedback about building energy use early in the design process, a model was

developed and implemented as a software design tool using the C++ programming language. The new program requires a limited amount of input from the user and runs simulations to predict heating and cooling loads for residential buildings. The user interface was created with the architect in mind, and it results in direct graphical comparisons of the energy requirements for different building designs. The simulations run hour by hour for the entire year using measured weather data. They typically complete in less than two seconds, allowing for very fast comparisons of different scenarios. A set of simulations was run to perform a comparison between the new program and an existing tool called Energy-10. Overall, the loads predicted by the two programs were in good agreement.

**Appendix B** 2001 This appendix provides methodologies for calculating the metrics requested in the GPRA2003 Data Call. The general framework for the

methodology is depicted in the Figure B-1 below. Additional details are provided in the sections that follow.

Richard R. Vaillencourt  
2020-12-17 Completely revised and updated, this fifth edition of a bestseller helps building managers identify what to look for and how to evaluate before making a decision about which guarantee is better for their building and which ESCO can best deliver energy savings. This reference will save countless hours doing energy feasibility studies and

associated calculations. The author, a practicing engineer, shares his secrets for simplifying complex energy calculations and demonstrates his unique, time-saving methods.

**Engineering and Analysis of Electro-Optical and Infrared**

**Systems** William Wolfgang Arrasmith 2025-06-30

There has been a lot of innovation in systems engineering and some fundamental advances in the field of optics, imaging, lasers, and photonics that warrant attention. This volume focuses on applications, tools, and techniques of systems engineering-related topics from government, industrial, and academic settings such as development and operations

(DevOps), agile methods, and the concept of the “digital twin.” Handbook of Systems Engineering and Analysis of Electro-Optical and Infrared Systems: Applications, Tools, and Techniques offers more information on the application of decision and risk analysis and statistical methods in systems engineering such as design of experiments (DOX) methods, including statistical process control, hypothesis testing, analysis of variance, blocking, 2k factorial analysis, and regression analysis. It includes new material using model-based systems engineering and systems architecture methods in a system-level design application. The integration of recent high-speed atmospheric turbulence research results in the optical technical examples and case studies to illustrate the new developments is also included. A presentation of new optical technical materials for adaptive optics (AO) and atmospheric turbulence compensation (ATC) systems that are based on illumination

from passive sources (natural light) or active sources (coherent light like from lasers) provides the technical focus for the systems engineering methods and techniques. Chapter 13 focuses on the technical aspects of the design process and uses the systems-level design as an illustration. In addition to covering lifecycle cost estimation methods and applying them to an integrated case study that is used to illustrate important concepts and techniques throughout this work, the final section brings everything together in terms of technical, cost, and schedule performance. Because this volume blends modern-day systems engineering methods with detailed optical systems analysis and applies these methodologies to EO/IR systems, this new edition is an excellent text for professionals in STEM disciplines that work with optical or infrared systems. It’s also a great practical reference text for the practicing engineer and a solid educational text for graduate-level systems engineering,

engineering, science, and technology students.
