The First Global Integrated Marine Assessment United Nations 2017-04-17 The World Ocean Assessment - or, to give its full title, The First Global Integrated Marine Assessment - is the outcome of the first cycle of the United Nations' Regular Process for Global Reporting and Assessment of the State of the Marine Environment, including Socioeconomic Aspects. The Assessment provides vital, scientifically-grounded bases for the consideration of ocean issues, including climate change, by governments, intergovernmental agencies, non-governmental agencies and all other stakeholders and policymakers involved in ocean affairs. Together with future assessments and related initiatives, it will support the implementation of the recently adopted 2030 Agenda for Sustainable Development, particularly its ocean-related goals. Moreover, it will also form an important reference text for marine science courses.

Introduction to Atmospheric Chemistry Peter V. Hobbs 2000-09-25 Introduction to Atmospheric Chemistry is a concise, clear review of the fundamental aspects of atmospheric chemistry. In ten succinct chapters, it reviews our basic understanding of the chemistry of the Earth's atmosphere and discusses current environmental issues, including air pollution, acid rain, the ozone hole, and global change. Written by a well-known atmospheric science teacher, researcher, and author of several established textbooks, this book is an introductory textbook for beginning university courses in atmospheric chemistry. Also suitable for self instruction, numerous exercises and solutions make this textbook accessible to students covering atmospheric chemistry as a part of courses in atmospheric science, meteorology, environmental science, geophysics and chemistry. Together with its companion volume, Basic Physical Chemistry for the Atmospheric Sciences (second edition 2000; Cambridge University Press), Introduction to Atmospheric Chemistry provides a solid introduction to atmospheric chemistry.

Controlling Air Pollution in China Therese Feng 1999 Rapid economic growth in China has been fueled by, and continues to stimulate, a huge demand for power, posing significant challenges to local, regional and international atmospheric environments. This timely book assesses this environmental risk and considers the efficient design of environmental policy in the development of new coal-fired plants in China. Coal-fired electricity generation currently accounts for about 80 per cent of China's power sector and so it is vital to establish how new plants can be designed to minimize the harmful environmental effects of this type of power generation. In designing pollution control policies in China there is a need to identify appropriate policies for a fast developing economy where incomes, attitudes and technology are also rapidly evolving. Therese Feng explores the use of societal values in developing environmental policies and presents an integrated assessment which carefully characterizes the nature and value of environmental

damage using the model of a new coal-fired power plant. Finally, the author defines an environmental policy which is sensitive to local variables and transboundary effects. Controlling Air Pollution in China will be of interest to energy and environmental economists and policymakers.

Examining Energy and the Environment around the World Bruce E. Johansen 2019-04-01 This volume addresses ten issues pertaining to energy and the environment, such as climate change, fossil fuels, endangered species, and renewable energy, and examines how these issues are affecting countries around the world. In the industrial age, first powered by coal and then more often by oil, environmental degradation nearly inevitably followed resource exploitation and energy production. This book examines environmental issues in specific countries around the world as well as solutions some of these countries have discovered in order to help save the environment. This volume includes 10 chapters, each addressing a specific issue relating to energy and the environment as it pertains to a variety of countries, including toxic chemicals, pollution, deforestation, and climate change. Each chapter begins with an introduction to the issue. Following the chapter introduction, each chapter highlights that issue in eight countries and provides historic perspective. This work provides an overview for high school students and college students at the undergraduate level on 10 important topics that address matters relating to energy and the environment in the 21st century.

Atmospheric Chemistry Barbara J. Finlayson-Pitts 1986-05-02 Provides comprehensive coverage of the new and emerging discipline of atmospheric chemistry. Starting with the fundamentals of kinetics and photochemistry, it shows how the experimental techniques in these areas are applied to the study and control of chemical reactions in the troposphere. Gives detailed analysis of such major societal issues as smog, acid rain and volatile toxic organics, and treats the seven criteria pollutants considered by the U.S. Environmental Protection Agency to be hazardous, as well as a variety of trace non-criteria pollutants, such as those cited in the Clean Air Act of 1977. Also included is a comprehensive bibliography and over 340 illustrations.

Introduction to Atmospheric Chemistry Daniel J. Jacob 1999 Atmospheric chemistry is one of the fastest growing fields in the earth sciences. Until now, however, there has been no book designed to help students capture the essence of the subject in a brief course of study. Daniel Jacob, a leading researcher and teacher in the field, addresses that problem by presenting the first textbook on atmospheric chemistry for a one-semester course. Based on the approach he developed in his class at Harvard, Jacob introduces students in clear and concise chapters to the fundamentals as well as the latest ideas and findings in the field. Jacob's aim is to show students how to use basic principles of physics and chemistry to describe a complex system such as the atmosphere. He also seeks to give students an overview of the current state of research and the work that led to this point. Jacob begins with atmospheric structure, design of simple models, atmospheric transport, and the continuity equation, and continues with geochemical cycles, the greenhouse effect, aerosols, stratospheric ozone, the oxidizing power of the atmosphere, smog, and acid rain. Each chapter concludes with a problem set based on recent scientific literature. This is a novel approach to problem-set writing, and one that successfully introduces students to the prevailing issues. This is a major contribution to a growing area of study and will be welcomed enthusiastically by students and teachers alike.
