quintillion bytes of data each day? This pace of data generation is the reason behind the popularity of high-end technologies such as Data Science, Artificial Intelligence, Machine Learning and so on. Data science involves extracting, processing and analyzing tons of data. So what we need are tools that can be used to store and manage this vast amount of data. Why is SQL needed for Data Science? SQL can be used to store, access and extract massive amounts of data in order to carry out the whole Data Science process more smoothly. The need for database support is critical, as companies rely on them on a daily basis to operate and grow. Additionally, many companies use Microsoft SQL Server as a database option for the power, innovative design, flexibility, and scalability covered in this book. Any SQL-related database or site will always be in demand, as it needs people like you to support and develop it. The Relational Database Management System (RDBMS)

is widely used by these technology giants not only to store large volumes of data, but also as an advanced tool to retrieve information from the vast amount of data generated by our lives each increasingly digital. SQL is the language of opinion that defines, manipulates, controls, and queries data in an RDBMS. In this book you will find: SQL Basics Installing MySQL applications The Data Definition Language Creating Your SQL Tables Built-In Functions & Calculations Working With Subqueries Different Types of Data to Use in SQL Using Joins In Sql And much more!!! This book is made to help as your own guide so you can learn as well as write efficient and effective SQL queries or statements to retrieve and update data in relevant databases such as MySQL.  stores data records is called a  
 database. It can be a file, CD,

 programming point of view, a  
 database is a methodically  
 structured repository of  
 indexed data information that  
 can be easily accessed by the  
 users for creating, retrieving,  
 updating and deleting  
 information. Data can be stored  
 in many forms. Most  
 applications require a database  
 for storing information. A  
 database can be of two types:  
 (1) flat database and (2)  
 relational database. As the  
 name suggests a flat database  
 has a two-dimensional  
 structure that has data fields  
 and records stored in one large  
 table. It is not capable of  
 storing complex information,  
 which creates a need for  
 relational databases. A

in several tables that are related to each other. Let's take the example of a school. A school will have to maintain data for several students. To find information for a student, we will first ask the class name. After the class name, we will ask for the first name. However, if there are two children with the same first name, then we will ask for the surname. If there are two children with identical names, we can still discriminate the information related to them based on their student id, parents' name, date of birth, siblings in the same school, etc. This is all related information. When all of this information is stored on paper, it takes a lot of time to retrieve it. The relational database allows easy access to all of this information. SQL is a computer language we can use to work with the various database management systems. It is the standard language for the various relational database management systems such as Oracle, MySQL, MS Access, SQL Server, Postgres, Sybase,

etc. With the use of SQL, a database user can create various database objects and perform various manipulations on them. When they have accomplished the tasks, they were using the objects for, the users can drop these database objects. A good example of a database object is a table which is a combination of rows and columns. Tables allow us to group our data into rows and columns. SQL allows you to create a table, insert data into it, manipulate this data and even drop it when you are done with its use. Besides this, SQL allows you to impose constraints on the table to restrict the data that can be inserted into that table. You must have data you need to store well. The data should be safeguarded against loss. If the data is sensitive, you need to safeguard it so it doesn't land into the wrong hands. You also need a way of organizing this data so it becomes easy for you to retrieve it. You only need to get a database management system and SQL will help you achieve all of this. This book is
