Electromagnetic Nondestructive Evaluation (V)

J. Pavon 2001 A collection of papers on electromagnetic nondestructive evaluation (NDE) techniques. Developments are discussed along with the implications of innovations for future inspection practice. Topics covered include: analytical and numerical modelling of electromagnetic NDE phenomena; solutions to NDE inverse problems; evaluation of material degradation in ferromagnetic structures; advanced sensors; industrial applications of NDE; and benchmark problems and solutions.

Electrical Engineering and Electromagnetics VI

C. A. Brebbia 2003 Continuing the focus of the series on numerical methods for electrical engineering and electromagnetics applications, the 32 papers discuss a wide range of computational methods and other aspects including applications in electrical machines, microwave applications, electromagnetic compatibility, numerical methods, and software packages. Other main themes are electromagnetic effects on the human body and equipment, and time-domain techniques. Among specific topics are the personal dosimetry of cellular phone linear and helical antennas for adults and children, the inverse scattering of a buried variable conducting cylinder, and a novel three-dimensional automatic mesh generation and refinement package. Electromagnetic Aquametry Klaus Kupfer

2005 This book covers all aspects of Electromagnetic Aquametry. It summarizes the

wide area of metrology and its applications in electromagnetic sensing of moist materials. The physical properties of water in various degrees of binding interacting with electromagnetic fields is presented by model systems. The book describes measurement methods and sensors in the frequency domain, TDR-techniques for environmental problems, methods and sensors for quality assessment of biological substances, and nuclear magnetic resonance techniques. Environmental sciences, as well as civil and geoen지니어ing, fossil fuels, food and pharmaceutical science are the main fields of application. A very wide frequency spectrum is used for dielectric measurement methods, but the microwave range is clearly dominant. Multiparameter methods as well as methods of principal components and artificial neural networks for density independent measurements are described.

Electromagnetic Methods in Geophysics

Fabio Giannino 2021-10-05 Discover the utility of four popular electromagnetic geophysical techniques In GeoRadar, FDEM, TDEM, and AEM Methods, accomplished researchers Fabio Giannino and Giovanni Leucci deliver an in-depth exploration of the theory and application of four different electromagnetic geophysical techniques: ground penetrating radar, the frequency domain electromagnetic method, the time domain electromagnetic method, and the airborne electromagnetic method. The authors offer a full description of each technique as they relate to the economics, planning, and logistics of deploying each of them on-site. The book also discusses the potential output of each method and how it can be combined with other sources of below- and above-ground information to create a digitized common point cloud containing a wide variety of data. Giannino and Leucci rely on 25 years of professional experience in over 40 countries around the world to provide readers with a fulsome description of the optimal use of GPR, FDEM, TDEM, and AEM, demonstrating their flexibility and applicability to a wide variety of use cases. Readers will also benefit from the inclusion of: A

thorough introduction to electromagnetic theory, including the operative principles and theory of ground penetrating radar (GPR) and the frequency domain electromagnetic method (FDEM) An exploration of hardware architecture and surveying, including GPR, FDEM, time domain electromagnetic method (TDEM), and airborne electromagnetic (AEM) surveying A collection of case studies, including a multiple-geophysical archaeological GPR survey in Turkey and a UXO search in a building area in Italy using FDEM /li> Discussions of planning and mobilizing a campaign, the shipment and clearance of survey equipment, and managing the operative aspects of field activity Perfect for forensic and archaeological geophysicists, GeoRadar, FDEM, TDEM, and AEM Methods will also earn a place in the libraries of anyone seeking a one-stop reference for the planning and deployment of GDR, FDEM, TDEM, and AEM surveying techniques.

Electromagnetic Waves and Radiating Systems

Dr. Gopinath Balakrishnan, Dr. Nithyakalyani Selvarajan, Dr. Devika S.V, Mr. Bhushan Sanjay Patil 2025-12-26 *Electromagnetic Waves and Radiating Systems* deal with the generation, propagation, and radiation of electromagnetic energy through space. Electromagnetic waves consist of electric and magnetic fields oscillating perpendicular to each other and travel at the speed of light. Radiating systems, such as antennas, convert electrical signals into electromagnetic waves for wireless communication. This subject covers key concepts including wave polarization, radiation patterns, impedance matching, and antenna parameters. These principles are essential in applications like radio broadcasting, satellite communication, radar, and mobile networks. Overall, electromagnetic waves and radiating systems form the foundation of modern wireless technologies.

Electromagnetic Environments and Health in Buildings Derek Clements-Croome

2004-03-01 With increasing use of mobile phones and VDUs, levels of background radiation and electromagnetism are rising, particularly in the workplace and also in the home. To some extent this is unavoidable, but

the level of dangers is unclear: is it trivially small, moderate or high? What are the risks of illness, and how can these be reduced to minimal or tolerable levels? Are some people more vulnerable than others? What can or should employers, building engineers and designers, product designers, workers and other members of the public do? This book, of which the chapters derive from presentations given by distinguished authorities at a major international conference, aims to present sound technical information on the whole range of key issues in a clear and accessible way.

The aim of this selection of papers is to bring together researchers working very deep in the basics of electromagnetic NDT on one hand and industrialist discussing their practical problems on the other hand. The papers cover topics as; Microwave applications and Material Characterization; General Eddy Current Inspection Tasks; Novel Techniques and Sensors; Magnetic Flux leakage Inspection; Steam Generator Eddy Current Inspection Tasks; and Material Characterization. Especially Novel Techniques and Sensors and Material Characterization are discussed on multiple papers. This publication gives a good overview of the many scientific problems in this area, but also explains the actual challenges for the scientific-technical community, like problems with in-line inspection of pipelines or the enhancing of the inspection performance in steam generator tubes inspection in the nuclear field. The material is important for scientists and engineers working in the field of electromagnetic non-destructive testing, in defect detection and sizing, as well as in

material characterization.
