

Eleven Stirling Engine Projects

Automotive Stirling Engine Development Project William D. Ernst 1997 The objectives of the Automotive Stirling Engine (ASE) Development project were to transfer European Stirling engine technology to the United States and develop an ASE that would demonstrate a 30% improvement in combined metro-highway fuel economy over a comparable spark ignition (SI) engine in the same production vehicle. In addition, the ASE should demonstrate the potential for reduced emissions levels while maintaining the performance characteristics of SI engines. Mechanical Technology Incorporated (MTI) developed the ASE in an evolutionary manner, starting with the test and evaluation of an existing stationary Stirling engine and proceeding through two experimental engine designs: the Mod I and the Mod II. Engine technology

development resulted in elimination of strategic materials, increased power density, higher temperature and efficiency operation, reduced system complexity, long-life seals, and low-cost manufacturing designs. Mod I engine dynamometer tests demonstrated that the engine system configuration had accomplished its performance goals for power (60 kW) and efficiency (38.5%) to within a few percent. Tests with the Mod II installed in a delivery van demonstrated a combined fuel economy improvement consistent with engine performance goals and the potential for low emissions levels. A modified version of the Mod II was identified as a manufacturable ASE design for commercial production. In conjunction with engine technology development, technology transfer proceeded through two ancillary efforts: the Industry Test and

Evaluation Program (ITEP) and the NASA Technology Utilization (TU) project. The ITEP served to introduce Stirling technology to industry, and the TU project provided vehicle field demonstrations for thirdparty evaluation in everyday use and accomplished more than 3100 hr and 8,000 miles of field operation. To extend technology transfer beyond the ASE project, a Space Act Agreement between MTI and NASA-Lewis Research Center allowed utilization of project resources for additional development work and emissions testing as part of an industry-funded Stirling Natural Gas Engine program.

British Secret Projects 3

Tony Buttler 2004 8 1/2 x 11, 180 b&w photos This title completes a trilogy covering the design and development of British fighters and bombers from the end of the biplane era to the present day. This new volume again emphasizes the designs that were never flown. It covers aircraft projects that were prepared from the mid-1930s onwards and that were influenced by the growing threat of another war with Germany, through to some projects which appeared after the war was over. The latter includes early jets such as the Attacker, Sea Hawk and Venom, which all flew post-war but were designed to wartime or immediate post-war requirements. Among the designs featured in this book are fixed-gun fighters, turret fighters, twin-engine cannon fighters, light, medium and heavy bombers, torpedo

bombers and flying boats. As in the trilogy's first two volumes, these designs are covered with detailed descriptions and data and numerous photographs of models or artists' impressions showing how these designs would have looked. Unlike the post-war years, details of many earlier unbuilt projects have been lost, but fortunately information on a great number of these has survived, and this will form the most complete record to be published on these fascinating machines.

Quick and Easy Stirling Engine

Jim R. Larsen 2011-09 Do you know how to make a working engine from soda cans? You do now! The Quick and Easy Stirling Engine book will show you every detail you need to know. There are no difficult secrets and no expensive parts to buy. With two soda cans and

a few other materials you can build a running engine in just a few hours. The engine featured in this book was designed for use in educational settings. Consulting with several educators, this engine was designed so that it could be assembled with simple hand tools by most builders in about three hours. The parts list is simple and affordable. Simple hand tools are all that is required for assembling this engine. Once assembled, the engine will spin a flywheel when the bottom is heated and ice is placed on top. This is a hot air engine design, sometimes referred to as a Stirling Engine. The engine makes motion by exercising a temperature differential. The bottom half of the engine must be warmed to about 250 degrees F, and the top of the engine must be cooled with cold water or ice. When these conditions are present, the engine will spin between 100 and 200 rpm. The primary components of this engine are soda cans, copper wire, and an old CD. The adhesive that is

used for construction is readily available at hardware stores. This engine is a fun project for students, home builders, hobbyists, and anyone who wants to learn how to make their own hot air engine from soda cans.
