Perception Nicola Bruno 2018-07-25 The world of perception is multisensory. Even a simple task such as judging the position of a light in a dark room depends not only on vision but also on sensory signals about the position of our body in space. Likewise, how we experience food depends on sensory signals originating from the mouth, but also from nose signals, and even vision and hearing. However, traditional books on perception still discuss each of the "senses" separately. This book takes a different stance: it defines perception as intrinsically multisensory from the start and examines multisensory interactions as key process behind how we perceive our own body, control its movements, perceive and recognise objects, respond to edible objects, perceive space, and perceive time. In addition, the book discusses multisensory processing in synaesthesia, multisensory attention, and the role of multisensory processing in learning. As an introduction to multisensory perception, this book is essential reading for students in psychology, philosophy, and neuroscience at the advanced undergraduate to postgraduate levels. As the chapters address topics that are often left out of standard textbooks, this book will also serve as a useful reference for specialist perception scientists and clinicians. Finally, as a monograph understandable to the educated non-specialist this book will also be of interest to professionals who need to take into account multisensory processing in domains such as, for instance, physiotherapy, neurological rehabilitation, human-computer interfaces, marketing, or the design of products and services.

Speech Production Wouter Hulstijn 1997 A selection of 62 reviewed papers on speech production as it relates to the other subjects. Combining theoretical and experimental studies, they explore models in speech production, methods and measurements in pathological speech, brain research, developmental aspects of speech production and fluency disorders, and other broad areas. The themes of speech motor control in stuttering and the assessment and developmental aspects of speech production in pathological speech have been carried over from earlier Nijmegen conferences. The collection is designed to be an authoritative text on the basic science of motor control in speech production, an introduction to the various new brain imaging techniques and how they are and can be used to study speech production, and a detailed account of the current studies. Review articles or opinions on methodologies or applications including the advantages and limitations of each are welcome. This Topic includes technologies and up-to-date methods which help advance the science. The contributions to this collection will undergo peer-review. Novelty and the utility of a method or protocol must be evident. We welcome contributions covering all aspects of novel brain imaging methods that aid clinicians in handling neurological and neuropsychiatric disorders as described above. Submissions will be handled by the team of Topic Editors. Frontiers in Neuroscience supports the FAIR (Findability, Accessibility, Interoperability, and Reusability) principles for scientific data management and stewardship (Wilkinson et al., *Sci. Data* 3:160018, 2016). This Research Topic welcomes: • Methods: Describing new methods that are significantly improved or adapted for specific purposes. These manuscripts may include primary (original) data. • Protocols: Detailed descriptions, including pitfalls and troubleshooting, to benefit those who may evaluate or employ the techniques. The protocols must be proven to work. • Perspective or General Commentaries on brain imaging methods and protocols relevant for aiding in the handling of neurological and neuropsychiatric disorders. • Reviews and mini-reviews of topical methods and protocols highlighting the important future directions of the field.

New challenges and future perspectives in brain imaging methods, 2nd edition Nico Sollmann 2024-10-22 Brain imaging has seen considerable advances over the recent years. Both developments and validation of advanced image acquisition techniques as well as post-processing and analyses pipelines contribute to contemporary imaging, including parallel imaging, (semi-)automated segmentation, generation of synthetic images, and application of machine learning and radiomics. Multi-modal approaches using structural, metabolic, and functional imaging are emerging to build a framework for a better understanding of anatomical features and physiological processes of the brain. This Research Topic intends to cover a broad theme, welcoming contributions spanning across the fields of (neuro)radiology, medical image analysis including machine learning, neurosurgery, and neurology, to reflect latest advances in the field of brain imaging. Original research, systematic / narrative / mini review, methods, perspective, clinical trial, case report, brief research report, general commentary, opinion, and technology and code manuscripts are welcome. A special focus is set on the following topics: - Multi-modal imaging (e.g., combination of structural, metabolic, molecular and functional imaging) - Utility of neuronavigation / virtual reality based on imaging data - Application of machine learning, artificial intelligence, and radiomics - Development of (semi-)automated image processing pipelines (e.g., segmentation algorithms) - Image acquisition acceleration / parallel imaging - Translational efforts that describe the transfer of advanced imaging approaches to the clinical setup and/or to a broader application in research - Emerging technology (e.g., mobile bedside MRI, functional ultrasound, magnetic particle imaging)
