Towards Design and Development of Secure and Privacy-Preserving Frameworks for IoT-enabled Networks Prabhat Kumar 2022-04-11 Doctoral Thesis / Dissertation from the year 2022 in the subject Computer Sciences - Internet of Things, IOT, grade: First, , course: PhD, language: English, abstract: With the advancement of low-cost and low energy-consuming sensors, the Internet of Things (IoT) is building a network of Internet-enabled devices. The concept of IoT is employed in almost all fields such as healthcare, smart cities, smart grids, energy distribution, agriculture, and even transportation. In a typical IoT-enabled network, smart sensors are geographically distributed to collect and process data within a smart infrastructure using an open channel, the Internet. However, the use of the Internet brings inherent vulnerabilities related to security (e.g., IoT devices can be compromised using advanced hacking techniques) and privacy (e.g., adversary performing inference and data poisoning attacks). Intrusion Detection System (IDS) and Cyber Threat Intelligence (CTI) are the two most extensively used techniques in IoT-enabled networks to safeguard the integrity and availability of sensitive smart systems. However, the presence of a large volume of data i.e., dimensionality curse and cloud-based centralized deployment mechanism hurts the IDS performance in terms of intrusion detection tasks and increased latency for data processing. On the other hand, modelling CTI is challenging due to the limited labels of cyber threat sources, and analysing these sources to extract relevant threat information manually is a time-consuming and error-prone procedure that necessitates a large investment of resources. This thesis provides substantial contributions to research on the building of a distributed IDS, a hybrid feature selection approach, an automated CTI Modelling and Identification scheme, and a deep privacy-encoding module for enhancing security and privacy of IoT-enabled networks.

Advanced Information Networking and Applications Leonard Barolli 2024-04-08 This book covers the theory, design and applications of computer networks, distributed computing and information systems. Networks of today are going through a rapid evolution and there are many emerging areas of information networking and their applications. Heterogeneous networking supported by recent technological advances in low-power wireless communications along with silicon integration of various functionalities such as sensing, communications, intelligence and actuations is emerging as a critically important disruptive computer class based on a new platform, networking structure and interface that enable novel, low-cost and high-volume applications. Several such applications have been difficult to realize because of many interconnection problems. To fulfill their large range of applications, different kinds of networks need to collaborate and wired and next-generation wireless systems should be integrated in order to develop high-performance computing solutions to problems arising from the complexities of these networks. This book aims to provide the latest research findings, innovative research results, methods and development techniques from both theoretical and practical perspectives related to the emerging areas of information networking and applications.

*Distributing Deep Neural Network Inference Across Edge-hub-cloud Systems* Robert Steven Viramontes 2025 Deep neural networks (DNNs) have been instrumental in the recent, rapid growth of artificial intelligence. DNNs have grown in compute complexity and requirements as they have advanced to achieve greater accuracy across a variety of domains. As these DNNs have been growing, they have also found use in a variety of applications that may be, for instance latency or energy constrained. This work explores distributed inference across multiple, heterogeneous devices as a method to meet optimization objectives. That is, each layer of the DNN is assigned to be computed on a particular device to e.g. minimize latency. The distributed inference problem is modeled as a flexible and extensible integer linear program (ILP). We then explore a variety of novel distributed inference approaches by extending this model, showing that these approaches improve objectives such as latency or energy compared to prior work. We first model a technique to reduce overall latency called weight preloading, taking advantage of opportunities to overlap compute and data movement. Then, based upon our observations during profiling, we introduce a novel constraint to ensure correct layer assignments and demonstrate a new technique for reducing profiling effort. We also demonstrate that device operating frequency may be used as a knob of control alongside layer assignment to trade off latency and energy during distributed inference. Finally, the model is extended to minimize carbon footprint over an application duration, demonstrating that distributed inference can be utilized to reduce environmental impact. This work demonstrates that distributed inference, as modeled by our ILP formulations, can effectively address a variety of application objectives.

Artificial Intelligence of Things (AIoT) Kashif

Naseer Qureshi 2024-04-05 This book is devoted

to the new standards, technologies, and communication systems for Artificial Intelligence of Things (AIoT) networks. Smart and intelligent communication networks have gained significant attention due to the combination of AI and IoT networks to improve human and machine interfaces and enhance data processing and services. AIoT networks involve the collection of data from several devices and sensor nodes in the environment. AI can enhance these networks to make them faster, greener, smarter, and safer. Computer vision, language processing, and speech recognition are some examples of AIoT networks. Due to a large number of devices in today's world, efficient and intelligent data processing is essential for problem-solving and decision-making. AI multiplies the value of these networks and promotes intelligence and learning capabilities, especially in homes, offices, and cities. However, several challenges have been observed in deploying AIoT networks, such as scalability, complexity, accuracy, and robustness. In addition, these networks are integrated with cloud, 5G networks, and blockchain methods for service provision. Many different solutions have been proposed to address issues related to machine and deep learning methods, ontology-based approaches, genetic algorithms, and fuzzy-based systems. This book aims to contribute to the state of the art and present current standards, technologies, and approaches for AIoT networks. This book focuses on existing solutions in AIoT network technologies, applications, services, standards, architectures, and security provisions. This book also introduces some new architectures and models for AIoT networks.
