Mechanics: Statics Seventh
Edition has provided a solid
foundation of mechanics
principles for more than 60
years. Now in its seventh
edition, the text continues to
help students develop their
problem-solving skills with an
extensive variety of engaging
problems related to
engineering design. More than
50% of the homework problems
are new, and there are also a
number of new sample
problems. To help students
build necessary visualization
and problem-solving skills, the
text strongly emphasizes

drawing free-body diagrams-
the most important skill needed
to solve mechanics problems.

2020-01-07 Essential
Mechanics - Statics and
Strength of Materials with
MATLAB and Octave combines
two core engineering science
courses - "Statics" and
"Strength of Materials" - in
mechanical, civil, and
aerospace engineering. It
weaves together various
essential topics from Statics
and Strength of Materials to
allow discussing structural
design from the very
beginning. The traditional
content of these courses are
reordered to make it
convenient to cover rigid body
equilibrium and extend it to
deformable body
mechanics. The e-book covers
the most useful topics from

both courses with computational support through MATLAB/Octave. The traditional approach for engineering content is emphasized and is rigorously supported through graphics and analysis. Prior knowledge of MATLAB is not necessary. Instructions for its use in context is provided and explained. It takes advantage of the numerical, symbolic, and graphical capability of MATLAB for effective problem solving. This computational ability provides a natural procedure for What if? exploration that is important for design. The book also emphasizes graphics to understand, learn, and explore design. The idea for this book, the organization, and the flow of content is original and new. The integration of computation, and the marriage of analytical and computational skills is a new valuable experience provided by this e-book. Most importantly the book is very interactive with respect to the code as it appears along with the analysis.

Stress, Strain, and Structural Dynamics Bingen Yang 2005-04-07
Stress, Strain, and Structural Dynamics is a comprehensive and definitive reference to statics and dynamics of solids and structures, including

mechanics of materials, structural mechanics, elasticity, rigid-body dynamics, vibrations, structural dynamics, and structural controls. This text integrates the development of fundamental theories, formulas and mathematical models with user-friendly interactive computer programs, written in the powerful and popular MATLAB. This unique merger of technical referencing and interactive computing allows instant solution of a variety of engineering problems, and in-depth exploration of the physics of deformation, stress and motion by analysis, simulation, graphics, and animation. This book is ideal for both professionals and students dealing with aerospace, mechanical, and civil engineering, as well as naval architecture, biomechanics, robotics, and mechatronics. For engineers and specialists, the book is a valuable resource and handy design tool in research and development. For engineering students at both undergraduate

and graduate levels, the book serves as a useful study guide and powerful learning aid in many courses. And for instructors, the book offers an easy and efficient approach to curriculum development and teaching innovation. - Combines knowledge of solid mechanics--including both statics and dynamics, with relevant mathematical physics and offers a viable solution scheme. - Will help the reader better integrate and understand the physical principles of classical mechanics, the applied mathematics of solid mechanics, and computer methods. - The Matlab programs will allow professional engineers to develop a wider range of complex engineering analytical problems, using closed-solution methods to test against numerical and other open-ended methods. - Allows for solution of higher order problems at earlier engineering level than traditional textbook approaches.

Pedestrian Falls Prevention and Protection In-Ju Kim
2022-03-25 This book explains how to improve the validity, reliability, and repeatability of slip resistance assessments amongst a range of shoes, floors, and environments from an engineering metrology viewpoint—covering theoretical and experimental aspects of slip resistance mechanics and mechanisms. Pedestrian falls resulting from slips or falls are one of the foremost causes of fatal and non-fatal injuries that limit people’s functionality. There have been prolonged efforts globally to identify and understand their main causes and reduce their frequency and severity. This book deals with large volumes of information on tribological characteristics such as friction and wear behaviours of the shoes and floors and their interactive impacts on slip resistance performances. Readers are introduced to theoretical concepts and models and collected evidence on slip resistance properties amongst a range of shoe and floor types

Meriam Kraige and materials under various ambulatory settings. These approaches can be used to develop secure design strategies against fall incidents and provide a great step forward to build safer shoes, floors, and walking/working environments for industries and communities around the world. The book includes many case studies.

2006-01-16 Interest in climbing and walking robots (CLAWAR) has increased remarkably over recent years. Novel solutions for complex and very diverse application fields (exploration/intervention in severe environments, personal services, emergency rescue operations, transportation, entertainment, medical, etc.), have been anticipated by great progress in this area of robotics. This book contains the proceedings of the 7th Climbing and Walking Robots 2004 (CLAWAR 2004) Conference, offering the international scientific community one of the most excellent forums for academics, researchers and industrialists interested in this motivating area of climbing and walking robots. It provides a wide forum of original state-of-the-art contributions from various industrial and new/emerging research fields, presenting a full picture of climbing and walking robots. The conference, held in Madrid, Spain, September
