Colloquium Fuels Nicolai
Schubert 2021-11-08 With the
signing of the Paris Agreement
in December 2015 the United
Nations explained their
willingness to limit the GHG
Emissions and contribute to the
measures against the global
warming effect. In 2019 the
European Commission
proposed the Green Deal and
as a consequence the target to
be climate neutral in 2050. In
consequence the fossil based
energy system has to transform
into a climate-neutral energy
system with renewable and
sustainable energy carriers.
Research on and development
of alternative fuels and new
production processes are
ongoing to provide the
technical solution. Political
actions are needed to provide
the economic framework for

the introduction of such alternative fuel solutions. The fulfilment of the European CO2 reduction targets until 2050 needs realistic technical solutions including backwards compatible approaches for existing vehicle fleets. An economic and sustainable development towards climate neutral mobility requires a holistic view based on life cycle assessments for the different mobility approaches including the economic impacts as well as financing options. A synergetic discussion of solutions for future fuels and powertrain technologies is needed to develop an economic pathway to a sustainable and affordable mobility of tomorrow. The challenging goal for mobility can only be achieved through an international cooperation of universities, the automobile industry, energy producers, the oil industry and the legislative bodies of the member states. The international colloquium aims to contribute to the development of a climate-neutral mobility by exchanging

views on and discussing all aspects connected with the "powertrain/fuel/environment" system, including the necessary political regulations. *Report on the Second International Technical Conference on Experimental Safety Vehicles 1971*

INCOBAT Eric Armengaud

2022-09-01 Electro-mobility is considered as a key technology to achieve green mobility and fulfil tomorrow's emission standards. However, different challenges still need to be faced to achieve comparable performances to conventional vehicles and finally obtain market acceptance. Two of these challenges are vehicle range and production costs. In that context, the aim of *INCOBAT* (October 2013 - December 2016) was to provide innovative and cost efficient battery management systems for next generation HV-batteries. *INCOBAT* proposes a platform concept that achieves cost reduction,

reduced complexity, increased reliability and flexibility while at the same time reaching higher energy efficiency. • Very tight control of the cell function leading to a significant increase of the driving range of the FEV; • Radical cost reduction of the battery management system with respect to current solutions; • Development of modular concepts for system architecture and partitioning, safety, security, reliability as well as verification and validation, thus enabling efficient integration into different vehicle platforms. The INCOBAT project focused on the following twelve technical innovations grouped into four innovation groups, which are summarized in this book: •

Customer needs and integration aspects •
Transversal innovation •
Technology innovation •

Fuel Consumption and Consumption Optimization

Michael Hilgers 2023-02-24

The aim of this work, consisting of 9 individual, self-contained booklets, is to describe commercial vehicle technology in a way that is clear, concise and illustrative. Compact and easy to understand, it provides an overview of the technology that goes into modern commercial vehicles. Starting from the customer's fundamental requirements, the characteristics and systems that define the design of the vehicles are presented knowledgeably in a series of articles, each of which can be read and studied on their own. In this volume, Fuel Consumption and Consumption Optimization, the main focus is placed on the factors for optimizing consumption in the conventional vehicle. Fuel consumption can be optimized by four different factors: the technology of the vehicle, the conditions of its operation, the behavior of the driver and the

maintenance and upkeep of the vehicle. These aspects are described in a way that is easily understood for training and practical application.

Internal Combustion Engine Handbook

Richard Van Basshuysen 2016-03-07 More than 120 authors from science and industry have documented this essential resource for students, practitioners, and professionals. Comprehensively covering the development of the internal combustion engine (ICE), the information presented captures expert knowledge and serves as an essential resource that illustrates the latest level of knowledge about engine development. Particular attention is paid toward the most up-to-date theory and practice addressing thermodynamic principles, engine components, fuels, and emissions. Details and data cover classification and characteristics of reciprocating engines, along with fundamentals about diesel and spark ignition internal combustion engines, including

insightful perspectives about the history, components, and complexities of the present-day and future IC engines. Chapter highlights include: • Classification of reciprocating engines • Friction and Lubrication • Power, efficiency, fuel consumption • Sensors, actuators, and electronics • Cooling and emissions • Hybrid drive systems Nearly 1,800 illustrations and more than 1,300 bibliographic references provide added value to this extensive study. "Although a large number of technical books deal with certain aspects of the internal combustion engine, there has been no publication until now that covers all of the major aspects of diesel and SI engines." Dr.-Ing. E. h. Richard van Basshuysen and Professor Dr.-Ing. Fred Schäfer, the editors, "Internal Combustion Engines Handbook: Basics, Components, Systems, and Perspectives"
