Algorithms on Strings, Trees, and Sequences

Dan Gusfield 1997 String algorithms are a traditional area of study in computer science. In recent years their importance has grown dramatically with the huge increase of electronically stored text and of molecular sequence data (DNA or protein sequences) produced by various genome projects. This 1997 book is a general text on computer algorithms for string processing. In addition to pure computer science, the book contains extensive discussions on biological problems that are cast as string problems, and on methods developed to solve them. It emphasises the fundamental ideas and techniques central to today's applications. New approaches to this complex material simplify methods that up to now have been for the specialist alone. With over 400 exercises to reinforce the material and develop additional topics, the book is suitable as a text for graduate or advanced undergraduate students in computer science, computational biology, or bioinformatics. Its discussion of current algorithms and techniques also makes it a reference for professionals.

Theoretical Computer Science Mario Coppo 2005-09-28 This book constitutes the refereed proceedings of the 9th International Conference on Theoretical Computer Science, ICTCS 2005, held at the Certosa di Pontignano, Siena, Italy, in October 2005. The 29 revised full papers presented together with an invited paper and abstracts of 2 invited talks were carefully reviewed and selected from 83 submissions. The papers address all current issues in theoretical computer science and focus especially on analysis and design of algorithms, computability, computational complexity, cryptography, formal languages and automata, foundations of programming languages and program analysis, natural computing paradigms (quantum computing, bioinformatics), program specification and verification, term rewriting, theory of logical design and layout, type theory, security, and symbolic and algebraic

computation.

Advances in Computers Marvin Zelkowitz 2009-05-11 This is volume 75 of *Advances in Computers*. This series, which began publication in 1960, is the oldest continuously published anthology that chronicles the ever-changing information technology field. In these volumes we publish from 5 to 7 chapters, three times per year, that cover the latest changes to the design, development, use and implications of computer technology on society today. In this present volume we present five chapters describing new technology affecting users of such machines. In this volume we continue a theme presented last year in volume 72 - High Performance Computing. In volume 72 we described several research projects being conducted in the United

States on the development of a new generation of high performance supercomputers.

It leads the reader through the entire solution process, from the original PDE, through the discretization stage, to the numerical solution of the resulting algebraic system. The well-debugged and tested code segments implement the numerical methods efficiently and transparently. Basic and advanced numerical methods are introduced and implemented easily and efficiently in a unified object-oriented approach.

An Introduction to String Algorithms Carl Kingsford 2026-05-19 An essential introduction to the building blocks of modern text processing String algorithms make it possible to process, store, and manipulate text with computational efficiency, with applications ranging from search engines and social networks that regularly process terabytes of information to areas like genomics, where the genome of an organism can be encoded as a long string of letters. This book provides an incisive introduction to the concepts and applications that every practitioner in the field needs to know. Ideal for the classroom and self-study, it guides readers from the fundamentals of string processing to advanced computational methods, presenting useful data structures and proof techniques for strings and other data and serving as an on-ramp to doing cutting-edge research in string algorithms. Discusses topics ranging from exact string matching and efficient edit distance computation to modern string data structures, sketching methods, and generative models of strings Covers data structures such as suffix trees,

suffix arrays, wavelet trees, the Burrows-Wheeler transform, the FM index, and compressed bit vectors Presents an array of algorithms along with their proofs of correctness and running time Develops the skills needed to design and implement new string algorithms as well as various algorithmic techniques that are applicable beyond string algorithms Invaluable for anyone interested in processing large collections of string data, including genomic sequences and text for training large language models Includes hundreds of exercises and explanatory figures An indispensable resource for graduate students, advanced undergraduates, researchers, and practitioners
