Chapter two reviews the necessary mathematical background dealing with vector and tensor operations and important theorems required in the development of microscopic equations of transport phenomena. Part 2 deals with momentum transport (fluid mechanics). It consists of seven chapters (chapters three to nine). Chapter three presents introductory concepts and definitions of momentum transport (fluid mechanics). Chapter four develops the microscopic equations of motions. The applications of the microscopic equations of motion are illustrated in chapter five. Chapter six is devoted to friction factor, friction factor correlations, and friction loss calculations in practical systems. The settling behaviour of particles is covered along with drift flux theory in chapter seven. Chapter eight is devoted to non-Newtonian flow. The flow of power law, Bingham plastic, and general time-independent non-Newtonian fluids is covered. Chapter nine deals with the flow of Newtonian and non-Newtonian fluids through packed beds and consolidated porous media. Part 3 deals with heat transport. It consists of six chapters (chapters ten to fifteen). Chapter ten presents general introduction to heat transfer dealing with different

modes of heat transfer (convection, conduction, and radiation). Chapter eleven is fully devoted to heat transfer in a stationary medium, that is, conductive heat transfer. Chapter twelve deals with heat transfer in a moving fluid. The microscopic equations of total energy and thermal energy are developed. The solutions of the thermal energy equation are illustrated for different situations. Chapter thirteen is devoted to heat transfer coefficient, heat transfer coefficient correlations, and applications of convective heat transfer including heat exchangers. Heat transfer with phase change such as in boiling and condensation is covered in chapter fourteen. The last chapter of part 3 is devoted to radiative heat transfer which covers the nature of thermal radiation and radiative heat exchange between surfaces at different temperatures. Part 4 deals with mass transport. It consists of five chapters (chapters sixteen to twenty). Chapter sixteen covers mass transfer in a stationary medium. Mass transfer in a moving fluid is presented in chapter seventeen. Chapter eighteen is devoted to mass transfer coefficient, mass transfer coefficient correlations, and interphase mass transfer. The analysis and design of packed towers for mass transfer are covered in detail in chapter nineteen. The last chapter of the book, that is, chapter twenty is devoted to multicomponent diffusion in gases and liquids. The available textbooks in transport phenomena rarely provide satisfactory coverage of multicomponent diffusion.

Modern Fluid Dynamics Clement Kleinstreuer 2018-04-25 Modern Fluid Dynamics, Second Edition provides up-to-date coverage of intermediate and advanced fluids topics. The text emphasizes

fundamentals and applications, supported by worked examples and case studies. Scale analysis, non-Newtonian fluid flow, surface coating, convection heat transfer, lubrication, fluid-particle dynamics, microfluidics, entropy generation, and fluid-structure interactions are among the topics covered. Part A presents fluids principles, and prepares readers for the applications of fluid dynamics covered in Part B, which includes computer simulations and project writing. A review of the engineering math needed for fluid dynamics is included in an appendix. *Basics of Research Writing in Computational Fluid Dynamics* Buddhi Prasad Sapkota, PhD 2025-08-12 Computational Fluid Dynamics (CFD) is developing rapidly, becoming an essential interface between theoretical and applied fluid mechanics through numerical simulations. With the increasing availability and use of CFD tools, the importance of effective technical writing has become paramount - whether for well-structured papers, theses, or technical reports. This book, *Basics of Research Writing in Computational Fluid Dynamics*, aims to equip students, researchers, and professionals with the skills needed to communicate CFD work effectively. While not a comprehensive guide to CFD theory or numerical methods (though fundamental concepts are introduced where necessary), this book focuses specifically on the writing process for CFD research; developing conceptual understanding and procedural skills; crafting abstracts, methods, results, and discussion sections and proper use of literature, algorithms, validation data, and software. This book serves as a valuable resource for graduate students writing theses or dissertations involving CFD; early-career researchers preparing journal articles or conference papers; industry professionals documenting simulation work in technical reports; non-native English speakers navigating CFD terminology in academic writing and students and practitioners across mathematics, engineering, and physics. The book includes annotated examples from published CFD literature, clear definitions of key terms and concepts, step-by-step guides for scientific writing. I extend my sincere gratitude to the global CFD community, particularly reviewers and editors; open-source developers advancing the field; colleagues who shared drafts and reviews and Booksclinic Pub-

lishing for their support. This book serves as a starting point for research communication. True mastery develops through practice, peer feedback, and engagement with scientific literature. While every effort has been made to ensure accuracy, I welcome suggestions for improvement in future editions.
